In mathematics, a fractal is a self-similar subset of Euclidean space whose fractal dimension strictly exceeds its topological dimension.Fractals appear the same at different levels, as illustrated in successive magnifications of the Mandelbrot set. Fractals exhibit similar patterns at increasingly small scales called self-similarity, also known as expanding symmetry or unfolding symmetry; if ...

The physics of far-from-equilibrium growth phenomena represents one of the main fields in which fractal geometry is widely applied. Computer models based on growing clusters made of identical subunits (particles) provide a particularly useful tool in the investigation of fractal growth and in determination of the most relevant factors affecting the geometrical properties of a growing object.
