Nerve conduction studies and needle electromyography (EMG) are tests performed to assess the health of nerves and muscles. A neurophysiologist stimulates specific nerves and muscles and studies the resulting activity to evaluate if the nerves and muscles are functioning normally.

Nerve Conduction Studies (NCS) and Electromyography (EMG) are diagnostic tests that can identify problems with nerves and muscles. They are often helpful in diagnosing: nerve injuries; compressed nerves in the spine or limbs (for example, carpal tunnel syndrome) dying back of the nerve endings in the feet (peripheral neuropathy) motor neuron disease

Electromyography (EMG) and nerve conduction studies are tests that measure the electrical activity of muscles and nerves. Nerves send out electrical signals to make your muscles react in certain ways. As your muscles react,

Nerve conduction studies and an EMG (electromyogram) help diagnose the causes of symptoms such as numbness or weakness in parts of the body. Your doctor is likely to recommend them as part of a package of scans and tests. Depending on the number of tests you have, the process typically takes 30 minutes.

produce. The Nerve Conduction test measures the speed at which impulses travel along a nerve. These tests help us to work out how well your nerves and muscles are functioning. They are often referred to collectively as an EMG test and may incorporate one or both of the above techniques. What does EMG stand for?
